MEINHARD®

ICP Glass & Quartz Components Since 1974

Since 1974, MEINHARD® nebulizers have been the industry standard: the best performance; the best value. Today, MEINHARD® nebulizers are standard on the largest selling ICP and ICPMS instruments. Our High Efficiency Nebulizer is the top-rated glass microconcentric nebulizer. Our Direct Injection High Efficiency Nebulizer is unmatched. All are available in quartz as well as borosilicate glass.

Introduced in 2011, the Plus Series Nebulizers feature an innovative, low-internal-volume capillary for fast sample analysis (wash-in and wash-out) and include high-purity gas and liquid fittings. They are available in borosilicate glass and quartz, as well as ultra high purity quartz for the most demanding applications.

MEINHARD® - Elemental Scientific Glassblowing wants to be your source for total sample introduction solutions. We are pleased to offer nebulizers in Teflon® PFA and polypropylene from Elemental Scientific. These microconcentric nebulizers are especially useful for small-volume samples and highly-corrosive solutions like HF. The Noordermeer v-groove nebulizer can handle suspended solids of 10% or more without clogging. The Burgener MiraMist® in Teflon® extends that capability to highly-corrosive solutions.

MEINHARD® - Elemental Scientific Glassblowing manufactures a broad array of spray chambers in glass and quartz: Scott double-pass, conical, cyclonic, double-pass cyclonic. We can fit your instrument or custom manufacture for your needs. We also offer double-pass spray chambers from ESI in Teflon® PFA for ultra-high-purity and corrosion resistance. ESI's cyclonic spray chambers in PFA are just the thing for ICP analysis of HF solutions.

MEINHARD® - Elemental Scientific Glassblowing has torches for all ICP and ICPMS instruments that are currently available, along with torches for instruments that have been out of production for ten years or more. Our quality is guaranteed; our prices are unrivaled.

If you would like to talk to our sample introduction experts, call or email. We will be pleased to work with you to get the most out of your ICP or ICPMS.

Argon Humidifier for High TDS Sample Analysis

The *pergo* improves performance of all MEINHARD® nebulizers for the routine analysis of brines, fusion digests and other high TDS samples.

A high-pressure membrane positioned inside a temperature-controlled water reservoir perfuses water vapor into the ICP-MS nebulizer gas stream. By increasing humidity in the argon nebulizer gas, the *pergo* prevents salt deposits at the nebulizer tip, improving short and long-term signal stability.

PRG-01-MAPlus *pergo* high solids accessory with TR+ MEINHARD® nebulizer

BENEFITS:

- Improved RSDs
- Improved short and long-term stability
- Improved detection limits
- Faster washout
- Ability to use high sensitivity nebulizers for high TDS samples
- Reduce long-term drift
- Extends the length of analytical runs

The unique *pergo* design offers many advantages over other types of argon humidifiers.

ADVANTAGES:

- Higher, more consistent humidity
- Superior long-term stability for high TDS samples
- Safe and easy to use
 - Atmospheric pressure water reservoir
- Optional USB communication for programmable humidity levels

TRP-50
TR+ Glass
Nebulizer

Water microdroplets continuously clean the inside of the nebulizer and prevent salt deposits.

Ar nebulizer gas is humidified using a tube-shaped membrane placed in a PFA water reservoir at atmospheric pressure. The water vapor condenses inside the nebulizer tip, preventing salt build-up.

MEINHARD® SiIQ+

High Purity Quartz ICPMS Nebulizer

The SiIQ+ nebulizer by MEINHARD® is perfect for applications requiring high sensitivity. Made from the highest purity synthetic quartz, the SiIQ+ nebulizer has low levels of trace elemental impurities, reducing the risk of sample contamination. SiIQ+ nebulizers improve wash-out rates and generate low, stable blanks that can enhance ICPMS detection limits.

SiIQ+ comes equipped with PFA FitKit gas and sample quick connect fittings that eliminate contaminants from conventional connectors commonly used on other nebulizers. The fittings can be rapidly attached and removed. The gas quick connect creates a snug seal around the maria on the SiIQ+ sidearm.

Each nebulizer is manufactured and tested to exacting specifications. The standard SiIQ+ nebulizer requires 50 psi for 1 L/min of argon carrier and 0.5 mL/min solution uptake. Other versions are available.

MEINHARD® SiIQ+ high purity nebulizer with PFA FitKit

Comparison of metal impurity in Glass and TQ+ Quartz nebulizers. Glass nebulizers have high levels of impurity for elements such as Al, Fe, K, Mg.

Comparison of metal impurity in SiIQ+ and TQ+ Quartz nebulizers. SiIQ+ impurities on average are 60 times lower than standard quartz nebulizers. Aluminum impurities in SiIQ+ nebulizers are more than 400,000 times lower than glass.

apex Q - Quartz Inlet System.

Features a quartz, o-ring-free flow path for high sensitivity, low background and rapid rinse-out of samples that do not contain hydrofluoric acid.

apex IR for Isotope Ratio Analysis.

Developed for isotope ratio analysis, the apex IR has a quartz flow path and includes an additional mixing chamber that further homogenizes and stabilizes the sample aerosol stream, resulting in a more stable signal.

apex HF for Hydrofluoric Acid Resistance.

Uses a high purity, o-ring-free PFA flow path for the introduction of samples containing hydrofluoric acid. The apex HF is recommended for many geochemical and semiconductor applications.

apex IR

apex Q

Preset dual temperature settings for heater and cooler. Patented flow path design ensures rapid wash in / washout.

PC³

PC³ Peltier Cooled Cyclonic Spray Chamber

The PC³ is a small, robust Peltier cooled cyclonic spray chamber. The PC³ offers the advantages of low memory effects, constant temperature, fast rinse-out and high sample transport efficiency. The cooled outer walls of the PC³ spray chamber enhance long-term signal stability, reduce polyatomic interferences such as oxides and reduce solvent loading when volatile organic solvents are analyzed.

PC³ Peltier Cooled Cyclonic Spray Chamber

- Two preset temperatures +2°C and -5°C
- Ideal for analysis of aqueous or aqueous/organic mixtures
- Low memory effects
- Constant temperature
- Fast rinse-out
- High sample transport efficiency

PLUS NEBULIZERS

with PFA FitKit Quick Connects

MEINHARD® Plus Nebulizers have the lowest dead volume of any glass or quartz nebulizer. The low dead volume and high sensitivity provide excellent detection limits and washout.

Each MEINHARD® Plus nebulizer comes with the FitKit+ gas and sample quick connect fittings. The connections are made with high-purity PFA, minimizing the chance of contamination during backflow events. The gas connection fits snugly over the maria on the sidearm of the nebulizer.

MEINHARD® SilQ+ high purity nebulizer
with PFA FitKit

Features for all MEINHARD® Plus Nebulizers:

- Self aspiration rate 0.5 mL/min with argon flow 1 L/min at 50 PSI (3.4 bar/345 kPa).
- Peristaltic pumped rate 0.1 mL/min to 3.0 mL/min.
- Includes FG Gas Quick Connect (PFA) and F2 Quick Connect with 0.5 mm i.d. ■ (orange marker) capillary, 70 cm.

Pearl Nebulizer Cleaner

For all quartz and glass concentric nebulizers

With this device a cleaning solution can be pumped manually in reverse, through both the sample and gas passages. Favorite cleaning solutions are - Sigma-Aldrich RBS-25 diluted about 20x, Deconex similarly diluted; - or - either of these, but with the addition of 10% methanol. When the wet-cleaning process is finished, rinse with DI water and flush dry with compressed air or inert gas.

The diagram below shows the 3 main types of blockages that can occur in pneumatic concentric nebulizers.

#1 - Deposits at this point are typically composed of salts coming out of solution. Such deposits can usually be removed by repeated rinsing of a concentric nebulizer with an appropriate solvent.

#2 - This sort of obstruction is the worst type, capable of breaking the tip of a glass capillary. If the deposit is insoluble, the only sure way to remove it is with a PEARL cleaner.

#3 - Deposits inside the capillary may go unnoticed for quite a while, particularly if the sample is pumped. Paper and textile fibers are often at fault.
